

**50 Ω RF Digital Attenuator**  
**7-bit, 31.75 dB, DC-6.0 GHz, Vss<sub>EXT</sub> option**

### Features

- HaRP™-enhanced CMOS device
- Attenuation options: 0.25 dB, 0.5 dB, or 1.0 dB steps to 31.75 dB
  - 0.25 dB monotonicity for ≤ 4.0 GHz
  - 0.5 dB monotonicity for ≤ 5.0 GHz
  - 1 dB monotonicity for ≤ 6.0 GHz
- High Linearity: Typical +59 dBm IIP3
  - Excellent low-frequency performance
- Optional External Vss Control (Vss<sub>EXT</sub>)
- 3.3 V or 5.0 V Power Supply Voltage
- Fast switch settling time
- Programming Modes:
  - Direct Parallel
  - Latched Parallel
  - Serial-Addressable: Program up to eight addresses 000 - 111
- High-attenuation state @ power-up (PUP)
- CMOS Compatible
- No DC blocking capacitors required

### Product Description

The SP43703 is a HaRP™-enhanced, high linearity, 7-bit RF Digital Step Attenuator (DSA). This highly versatile DSA covers a 31.75 dB attenuation range in 0.25 dB, 0.5 dB, or 1.0 dB steps. The customer can choose which step size and associated specifications are best suited for their application. The SIPAT 50 Ω RF DSA provides multiple CMOS control interfaces and an optional external Vss feature. It maintains high attenuation accuracy over frequency and temperature and exhibits very low insertion loss and low power consumption. Performance does not change with Vdd due to on-board regulator. This next generation SIPAT DSA is available in a 5x5 mm 32-lead QFN footprint.

The SP43703 is manufactured on SIPAT's CMOS process, a patented variation of silicon-on-insulator (SOI) technology on a sapphire substrate, offering the performance of GaAs with the economy and integration of conventional CMOS.

Pin No.	Pin Name	Description
1	N/C	No Connect
2	V <sub>DD</sub>	Power supply pin
3	P/S	Serial/Parallel mode select
4	A0	Address Bit A0 (LSB)
5	GND	Ground
6	GND	Ground
7	RF1	RF1 port
8 - 17	GND	Ground
18	RF2	RF2 port
19	GND	Ground
20	V <sub>SS<sub>EXT</sub></sub>	External Vss Control
21	A2	Address Bit A2
22	A1	Address Bit A1
23	LE	Latch Enable input
24	CLK	Serial interface clock input
25	SI	Serial Interface input
26	C16	Attenuation control bit, 16 dB
27	C8	Attenuation control bit, 8 dB
28	C4	Attenuation control bit, 4 dB
29	C2	Attenuation control bit, 2 dB
30	C1	Attenuation control bit, 1 dB
31	C0.5	Attenuation control bit, 0.5 dB
32	C0.25	Attenuation control bit, 0.25 dB
Paddle	GND	Ground for proper operation

### Electrostatic Discharge (ESD) Precautions

When handling this CMOS device, observe the same precautions that you would use with other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the specified rating.

### Latch-Up Avoidance

Unlike conventional CMOS devices, SIPAT'S CMOS devices are immune to latch-up.

### Optional External Vss Control (V<sub>SS<sub>EXT</sub></sub>)

For proper operation, the V<sub>SS<sub>EXT</sub></sub> control must be grounded or at the V<sub>SS</sub> voltage specified in the Operating Ranges table. When the V<sub>SS<sub>EXT</sub></sub> control pin on the package is grounded the switch FET's are biased with an internal low spur negative voltage generator. For applications that require the lowest possible spur performance, V<sub>SS<sub>EXT</sub></sub> can be applied to bypass the internal negative voltage generator to eliminate the spurs.

### Switching Frequency

The SP43703 has a maximum 25 kHz switching rate when V<sub>SS<sub>EXT</sub></sub> is grounded. Switching rate is defined to be the speed at which the DSA can be toggled across attenuation states.

### Moisture Sensitivity Level

The Moisture Sensitivity Level rating for the SP43703 in the 5x5 QFN package is MSL1.

### Exposed Solder Pad Connection

The exposed solder pad on the bottom of the package must be grounded for proper device operation.

**Table 5. Operating Ranges**

Parameter	Min	Typ	Max	Units
V <sub>DD</sub> Power Supply Voltage	3.0	3.3		V
V <sub>DD</sub> Power Supply Voltage		5.0	5.5	V
V <sub>SS<sub>EXT</sub></sub> Negative Power Supply Voltage <sup>1</sup>	-3.0	-2.7	-2.4	V
I <sub>DD</sub> Power Supply Current		70	350	μA
Digital Input High	2.6		5.5	V
P <sub>IN</sub> Input power (50Ω): 1 Hz ≤ 20 MHz 20 MHz ≤ 6 GHz			See fig. 28 +23	dBm dBm
T <sub>OP</sub> Operating temperature range	-40	25	85	°C
Digital Input Low	0		1	V
Digital Input Leakage			15	μA

Note: 1. Applied only when external VSS power supply used. Pin 20 must be grounded when using internal Vss supply

**Table 6. Absolute Maximum Ratings**

Symbol	Parameter/Conditions	Min	Max	Units
V <sub>DD</sub>	Power supply voltage	-0.3	6.0	V
V <sub>SS<sub>EXT</sub></sub>	Vss External Negative Power Supply Voltage (optional)	-4.0	0.3	V
V <sub>I</sub>	Voltage on any Digital input	-0.3	5.8	V
P <sub>IN</sub>	Input power (50Ω) 1 Hz ≤ 20 MHz 20 MHz ≤ 6 GHz		See fig. 28 +23	dBm dBm
T <sub>ST</sub>	Storage temperature range	-65	150	°C
V <sub>ESD</sub>	ESD voltage (HBM) <sup>1</sup> ESD voltage (Machine Model)		500 100	V V

Note: 1. Human Body Model (HBM, MIL\_STD 883 Method 3015.7)

Exceeding absolute maximum ratings may cause permanent damage. Operation should be restricted to the limits in the Operating Ranges table. Operation between operating range maximum and absolute maximum for extended periods may reduce reliability.

**Figure 28. Maximum Power Handling Capability: Z<sub>0</sub> = 50 Ω**

X	L	L	L	L	L	L	H	0.25 dB
X	L	L	L	L	L	H	L	0.5 dB
X	L	L	L	L	H	L	L	1 dB
X	L	L	L	H	L	L	L	2 dB
X	L	L	H	L	L	L	L	4 dB
X	L	H	L	L	L	L	L	8 dB
X	H	L	L	L	L	L	L	16 dB
X	H	H	H	H	H	H	H	31.75 dB

**Table 12. Serial-Addressable Register Map**

Attenuation Word is derived directly from the attenuation value. For example, to program the 18.25 dB state at address 3:

Address word: XXXXX011  
 Attenuation Word: Multiply by 4 and convert to binary  $\rightarrow 4 * 18.25 \text{ dB} \rightarrow 73 \rightarrow \text{X1001001}$   
 Serial Input: XXXXX011X1001001

## Programming Options

### Parallel/Serial Selection

Either a parallel or serial interface can be used to control the SP43703. The  $\bar{P}/S$  bit provides this selection, with  $\bar{P}/S=LOW$  selecting the parallel interface and  $\bar{P}/S=HIGH$  selecting the serial interface.

### Parallel Mode Interface

The parallel interface consists of seven CMOS-compatible control lines that select the desired attenuation state, as shown in *Table 9*.

The parallel interface timing requirements are defined by *Fig. 30* (Parallel Interface Timing Diagram), *Table 9* (Parallel Interface AC Characteristics), and switching speed (*Table 1*).

For *latched*-parallel programming the Latch Enable (LE) should be held LOW while changing attenuation state control values, then pulse LE HIGH to LOW (*per Fig. 30*) to latch new attenuation state into device.

For *direct* parallel programming, the Latch Enable (LE) line should be pulled HIGH. Changing attenuation state control values will change device state to new attenuation. Direct Mode is ideal for manual control of the device (using hardware, switches, or jumpers).

### Serial-Addressable Interface

The serial-addressable interface is a 16-bit serial-in, parallel-out shift register buffered by a transparent latch. The 16-bits make up two words comprised of 8-bits each. The first word is the Attenuation Word, which controls the state of the DSA. The second word is the Address Word, which is compared to the static (or programmed) logical states of the A0, A1 and A2 digital inputs. If there is an address match, the DSA changes state; otherwise its current state will remain unchanged. *Fig. 29* illustrates a example timing diagram for programming a state. It is recommended that all parallel control inputs be grounded when the DSA is used in Serial Mode.

The serial-addressable interface is controlled using three CMOS-compatible signals: Serial-In (SI), Clock (CLK), and Latch Enable (LE). The SI and CLK inputs allow data to be serially entered into the shift register. Serial data is clocked in LSB first, beginning with the attenuation word.

The shift register must be loaded while LE is held LOW to prevent the attenuator value from changing as data is entered. The LE input should then be toggled HIGH and brought LOW again, latching the new data into the DSA. Address word and attenuation word truth tables are listed in *Table 10* & *Table 11*, respectively. A programming example of the serial-addressable register is illustrated in *Table 12*. The serial-addressable timing diagram is illustrated in *Fig. 29*.

## Power-up Control Settings

The SP43703 will always initialize to the maximum attenuation setting (31.75 dB) on power-up for both the serial-addressable and latched-parallel modes of operation and will remain in this setting until the user latches in the next programming word. In direct-parallel mode, the DSA can be preset to any state within the 31.75 dB range by pre-setting the parallel control pins prior to power-up. In this mode, there is a 400- $\mu$ s delay between the time the DSA is powered-up to the time the desired state is set. During this power-up delay, the device attenuates to the maximum attenuation setting (31.75 dB) before defaulting to the user defined state. If the control pins are left floating in this mode during power-up, the device will default to the minimum attenuation setting (insertion loss state).

Figure 29. Serial-Addressable Timing Diagram

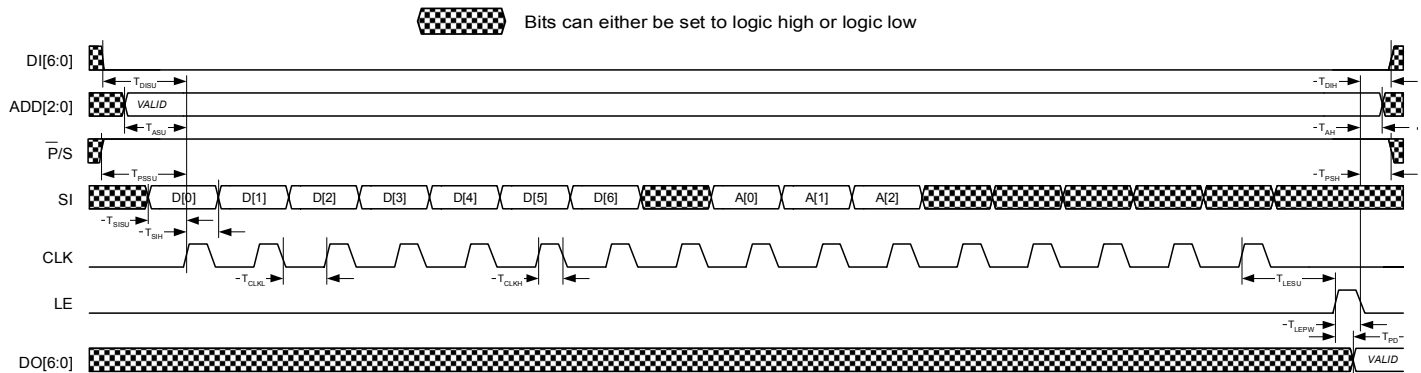

Figure 30. Latched-Parallel/Direct-Parallel Timing Diagram

Table 13. Serial Interface AC Characteristics

$V_{DD} = 3.3$  or  $5.0$  V,  $-40^{\circ}\text{C} < T_A < 85^{\circ}\text{C}$ , unless otherwise specified

Symbol	Parameter	Min	Max	Unit
$f_{CLK}$	Serial clock frequency	-	10	MHz
$T_{CLKH}$	Serial clock HIGH time	30	-	ns
$T_{CLKL}$	Serial clock LOW time	30	-	ns
$T_{LESU}$	Last serial clock rising edge setup time to Latch Enable rising edge	10	-	ns
$T_{LEPW}$	Latch Enable min. pulse width	30	-	ns
$T_{SISU}$	Serial data setup time	10	-	ns
$T_{SIH}$	Serial data hold time	10	-	ns
$T_{DISU}$	Parallel data setup time	100	-	ns
$T_{DIH}$	Parallel data hold time	100	-	ns
$T_{ASU}$	Address setup time	100	-	ns
$T_{AH}$	Address hold time	100	-	ns
$T_{PSSU}$	Parallel/Serial setup time	100	-	ns
$T_{PSH}$	Parallel/Serial hold time	100	-	ns
$T_{PD}$	Digital register delay (internal)	-	10	ns

Note:  $f_{CLK}$  is verified during the functional pattern test. Serial programming sections of the functional pattern are clocked at 10 MHz to verify  $f_{CLK}$  specification.

Table 14. Parallel and Direct Interface AC Characteristics

$V_{DD} = 3.3$  or  $5.0$  V,  $-40^{\circ}\text{C} < T_A < 85^{\circ}\text{C}$ , unless otherwise specified

Symbol	Parameter	Min	Max	Unit
$T_{LEPW}$	Latch Enable minimum pulse width	30	-	ns
$T_{DISU}$	Parallel data setup time	100	-	ns
$T_{DIH}$	Parallel data hold time	100	-	ns

$T_{PSIH}$	Parallel/Serial hold time	100	-	ns
$T_{PD}$	Digital register delay (internal)	-	10	ns
$T_{DIPD}$	Digital register delay (internal, direct mode only)	-	5	ns

## Evaluation Kit

The Digital Attenuator Evaluation Kit board was designed to ease customer evaluation of the SP43703 Digital Step Attenuator.

### *Direct-Parallel Programming Procedure*

For automated direct-parallel programming, connect the test harness provided with the EVK from the parallel port of the PC to the J1 & Serial header pin and set the D0-D6 SP3T switches to the 'MIDDLE' toggle position. Position the Parallel/Serial (P/S) select switch to the Parallel (or left) position. The evaluation software is written to operate the DSA in either Parallel or Serial-Addressable Mode. Ensure that the software is set to program in *Direct-Parallel* mode. Using the software, enable or disable each setting to the desired attenuation state. The software automatically programs the DSA each time an attenuation state is enabled or disabled.

For manual direct-parallel programming, disconnect the test harness provided with the EVK from the J1 and Serial header pins. Position the Parallel/Serial (P/S) select switch to the Parallel (or left) position. The LE pin on the Serial header must be tied to  $V_{DD}$ . Switches D0-D6 are SP3T switches which enable the user to manually program the parallel bits. When any input D0-D6 is toggled 'UP', logic high is presented to the parallel input. When toggled 'DOWN', logic low is presented to the parallel input. Setting D0-D6 to the 'MIDDLE' toggle position presents an OPEN, which forces an on-chip logic low. Table 9 depicts the parallel programming truth table and Fig. 30 illustrates the parallel programming timing diagram.

### *Latched-Parallel Programming Procedure*

For automated latched-parallel programming, the procedure is identical to the direct-parallel method. The user only must ensure that *Latched-Parallel* is selected in the software.

For manual latched-parallel programming, the procedure is identical to direct-parallel except now the LE pin on the Serial header must be logic low as the parallel bits are applied. The user must then pulse LE from 0V to  $V_{DD}$  and back to 0V to latch the programming word into the DSA. LE must be logic low prior to programming the next word.

**Figure 31. Evaluation Board Layout**

SIPAT Specification 101-0312

Note: Reference Fig. 32 for Evaluation Board Schematic

### *Serial-Addressable Programming Procedure*

Position the Parallel/Serial (P/S) select switch to the Serial (or right) position. Prior to programming, the user must define an address setting using the ADD header pin. Jump the middle pins on the ADD header A0-A2 (or lower) row of pins to set logic high, or jump the middle pins to the upper row of pins to set logic low. If the ADD pins are left open, then 000 become the default address. The evaluation software is written to operate the DSA in either Parallel or Serial-Addressable Mode. Ensure that the software is set to program in *Serial-Addressable* mode. Using the software, enable or disable each setting to the desired attenuation state. The software automatically programs the DSA each time an attenuation state is enabled or disabled.
